

# Up-Flow Platform

## Developer Onboarding Guide

March 2026 • v1.0

# 1. What Is This Project?

Up-Flow is a wastewater treatment company (Israeli SMB). This app is an internal operational dashboard that sits on top of Monday.com — it syncs data from Monday boards into Supabase (Postgres) and presents a role-based control layer for the team.

## Core principle:

- Monday.com is the source of truth — the app never replaces it
- The app adds visibility, exceptions, and (eventually) controls
- All writes go back to Monday; Supabase is a read-optimized cache

## Users:

- CEO / Admin — full visibility, all boards, exceptions dashboard
- Operations — same as Admin for operational data
- Technician — sees only their own schedule and operations
- Viewer — read-only, scoped visibility

# 2. Tech Stack

| Layer         | Technology                                       | Notes                                            |
|---------------|--------------------------------------------------|--------------------------------------------------|
| Frontend      | <a href="#">React + TypeScript + Vite</a>        | Single-page app, dark theme                      |
| Backend / API | <a href="#">Vite middleware (server-side TS)</a> | No separate Node process — all in vite.config.ts |
| Database      | <a href="#">Supabase (Postgres)</a>              | Runtime cache synced from Monday                 |
| Auth          | <a href="#">Monday OAuth + Google Identity</a>   | Session-based, role from Monday board            |
| Data source   | <a href="#">Monday.com API</a>                   | 5 boards, synced on demand or daily auto-sync    |
| Calendar      | <a href="#">Google Calendar</a>                  | Events linked to schedule entries                |
| Hosting       | <a href="#">TBD / local dev</a>                  | Currently run locally with npm run dev           |

## 3. Repository Structure

Branch: `feature/runtime-sync-operational-model`  
Repo: `https://github.com/rotempotok-sys/upflow-platform-codex`

| Path                                      | What is it                                                                                    |
|-------------------------------------------|-----------------------------------------------------------------------------------------------|
| <code>src/features/</code>                | One folder per screen: home, assistant, team, clients, calendar, equipment, auth, permissions |
| <code>src/types/scheduling.ts</code>      | All shared TypeScript types ( <code>RuntimeOperationSnapshot</code> , etc.)                   |
| <code>src/App.tsx</code>                  | Main app shell — routing, auth state, data fetch, sync button                                 |
| <code>server/runtime/read.ts</code>       | Reads from Supabase and maps to snapshot types                                                |
| <code>server/runtime/sync.ts</code>       | Writes Monday data into Supabase (the sync pipeline)                                          |
| <code>server/runtime/exceptions.ts</code> | Exception engine — computes 9 exception types from snapshot                                   |
| <code>server/auth/</code>                 | Auth/authz: session, Monday OAuth, permissions, guards                                        |
| <code>supabase/schema/</code>             | SQL migrations 001–008 (run in order in Supabase SQL Editor)                                  |
| <code>docs/</code>                        | Board specs, sync plan, system blueprints                                                     |

## 4. Local Setup

### Prerequisites

- Node.js 20+
- npm 10+
- Access to the GitHub repo (ask Rotem to add you as collaborator)
- `.env.local` file — get from Rotem directly (not in repo)

### Steps

1. Clone the repo

```
git clone https://github.com/rotempotok-sys/upflow-platform-codex.git cd upflow-platform-codex
```

2. Install dependencies

```
npm install
```

3. Add `.env.local` in the project root (get from Rotem)

*The app will not start without the correct env vars. Key vars: `SUPABASE_URL`, `SUPABASE_SERVICE_ROLE_KEY`, `MONDAY_API_TOKEN`, `SESSION_SECRET`*

4. Start the dev server

```
npm run dev
```

App runs at: <http://localhost:5173>

5. Log in with your Monday.com account

Authentication is done via Monday OAuth. Your account must be approved in the Monday employees board (ask Rotem).

## 5. Data Architecture

### Data Flow

---

Monday.com → Sync endpoint → Supabase → /api/runtime-db/snapshot → React UI

The sync is triggered:

- Automatically on first app open each day (auto-sync)
- Manually via the  button in the app header (Admin/Operations only)
- Via POST /api/runtime-db/sync/monday-snapshot (requires auth)

### Monday Boards

---

| Board             | ID         | Purpose                                               |
|-------------------|------------|-------------------------------------------------------|
| Employees (Auth)  | 1729562303 | Users, roles, permissions, client/facility assignment |
| Operations Center | 1798247340 | Central ops hub — all incoming operations             |
| Employee Schedule | 1783389345 | Task scheduling, technician assignment, calendar link |
| Field Reports     | 1282241018 | Execution reports, QA, billing                        |
| Procurement       | 1281580539 | Procurement tracking by stage                         |

### Operation Lifecycle

---

The flow differs by operation type (service / project / logistics / procurement), but the general chain is:

**Incoming → Assign technician → Schedule (moz + calendar) → Field execution → Report → QA → Close**

### Operation ID

---

Each operation has a 4-digit short ID derived from its Monday item\_id. This ID is the join key across all boards:

- text\_mknfnj59 in Employee Schedule
- text\_mkmemh8m in Field Reports

Do not rely on item names or text matching for joins — always use the ID fields.

## 6. Current State of the App

### What is working

---

- Authentication: Monday OAuth + session management
- Monday → Supabase sync for all 5 boards
- Home Dashboard: KPI cards, unassigned ops, today schedule, exceptions, technician load
- Clients / Facilities view
- Team view
- Equipment board
- Calendar view
- AI assistant (Operations Agent)
- Exceptions engine: 9 exception types computed from snapshot
- Role-based visibility (Admin/Operations vs Technician)

### What is next (UI focus)

---

- Improve Home Dashboard visual design and UX
- Operations detail view (click into an operation for full details)
- Better mobile layout (used by technicians in the field)
- Filtering / search on operations and schedule
- Future: write actions from the app (change status, assign technician, send message)

### Key files to know as a UI developer

---

| File                                | Why you care                                                                            |
|-------------------------------------|-----------------------------------------------------------------------------------------|
| src/App.tsx                         | App shell, navigation, all state. Add new views here.                                   |
| src/features/home/HomeDashboard.tsx | Main landing screen. Currently uses inline styles — good candidate for a design system. |
| src/types/scheduling.ts             | All data types. Read this before touching any feature.                                  |
| src/index.css                       | Global CSS. App uses a dark theme.                                                      |

# 7. Working Together

## Branch Strategy

---

- Current working branch: feature/runtime-sync-operational-model
- Create your UI branch off this: git checkout -b feature/ui-[your-feature]
- Open a PR to main when ready for review

▮ *Do not push directly to main.*

## env.local

---

The .env.local file is not in the repo. It contains:

- SUPABASE\_URL and SUPABASE\_SERVICE\_ROLE\_KEY
- MONDAY\_API\_TOKEN
- SESSION\_SECRET and GOOGLE\_CLIENT\_ID / SECRET
- Monday board IDs and column mapping constants

Get the file from Rotem over a secure channel.

## Supabase Access

---

You can get read access to the Supabase project for debugging. Ask Rotem to invite you via supabase.com → Project Settings → Team.

## Contact

---

Rotem Potok — CEO & product owner
